NETFLIX DATA ANALYTICS

TASK 01 | DATA CLEANING & PREPARATION

Project	Netflix Data Analytics
Task	Netflix Data Cleaning & Preparation
Tools	Python, Pandas, Visual Studio Code
Input	data/raw/Dataset.csv
Output	data/processed/netflix_cleaned.csv

Prepared for the Data Analysis Using Python internship task.

1. Objective

Inspect, standardize, validate, and prepare the Netflix dataset for subsequent analysis and reporting.

2. Dataset Overview

The supplied CSV contains 8,790 records and 10 columns: show_id, type, title, director, country, date_added, release_year, rating, duration, and listed_in.

3. Tools & Technologies

Python • Pandas • Visual Studio Code • CSV

4. Work Performed

Step	Activity
1	Imported the CSV dataset using Pandas.
2	Inspected dimensions, column information, data types, and unique values.
3	Checked missing values and duplicate records.
4	Reviewed text formatting and categorical values.
5	Trimmed leading/trailing whitespace and normalized repeated whitespace in text columns.
6	Standardized content type labels and country separator spacing.
7	Exported the processed dataset as a separate CSV file.
8	Validated dimensions, missing values, duplicates, and content type counts.

5. Data Quality Results

Metric	Result
Original dataset shape	8,790 rows × 10 columns
Cleaned dataset shape	8,790 rows × 10 columns
Missing values after processing	0
Duplicate records after processing	0
Movies	6,126
TV Shows	2,664

6. Key Findings

• The dataset retained its original dimensions after processing.
• No missing values or duplicate records were reported in final validation.
• The dataset contains 6,126 Movies and 2,664 TV Shows.
• The cleaned CSV was exported separately, preserving the raw input file.

7. Notes & Further Work

The validation output shows date_added as a string data type. Convert it to datetime in a later date-based analysis step if required. Since the initial dataset had no missing values or duplicate rows, no records were removed for those reasons.

8. Output File

data/processed/netflix_cleaned.csv

9. Conclusion

The Netflix dataset was inspected, text formatting was standardized, and the resulting dataset was validated and exported. It is ready for the next content analysis task.
